

Cerec Connect

As an official beta test site for the **Sirona Inlab** system, **Renstrom Dental Studio** has kept pace with the updates in the dental **CAD/CAM** industry.

Our laboratory has Sirona's most recent milling system, the inlab **MC LX**. The system is capable of producing a complete range of dental restorations with more advanced precision and speed.

Along with the hardware, **Renstrom** has the CAD/CAM software, which is able to receive a digital impression from all Cerec doctors through **Cerec Connect**. For this to be possible, dentists must upload the software to their Cerec system. Non-Cerec users have the option of purchasing the new acquisition center*.

Cerec Connect notifies our lab of the incoming file, and Renstrom receives the scan through a web-based portal. This means we have direct digital communication with the doctor and dental lab technician.

While dentists are primarily using their Cerec milling units for posterior and inlay/ onlay restorations, the lab will receive a physical model with each case, allowing for the fabrication of any type of tooth restoration. Scan and check the prep design and fill out the digital prescription. It's as easy as it sounds!

Add another level of quality and value to your restorative and cosmetic dentistry results by choosing **Renstrom** dental laboratory.
