

Mark Clausen
Model room Technician

My Role at Renstrom

Being one of only three technicians in the model room, my day is filled with a variety of different tasks. Because the model room is where each case begins in the fabrication process, it is very crucial that it is handled properly and carefully. I start by pouring the models, grinding them, pinning, and then mounting. I paint and seal all of the dies and also help with any maintenance work that is needed in the lab.

Highlights of My Career

- Most of my years in dental technology have been spent working in the model room.
- I also have experience working in the metal department, waxing, and casting.
- Giving doctors a tour through the model room has always been enjoyable, which includes explaining and showing them how things are done at the lab.

My Personal Mission Statement

"When I started working at Renstrom, quality was the first thing that came to my mind. Everyone really takes the time to get things done right which is what I really like about working here. We communicate and work things out together, and that starts with me, being I am one of the first technicians to see each case. If I can predict a problem before it happens, we all make out better in the end, including the patient."
